310010 Differential Valve

Dec. 2014

The 310010 is a relay valve with delivery that can be higher than the control signal. This output differential can be adjusted to deliver from 0 to 25 psi greater than the control signal up to the maximum reservoir pressure. The differential pressure is consistent through out the delivery range. For example with a 15 psi. setting the valve will delivery 15 psi. more than the control line pressure from zero to the maximum reservoir pressure.

As with all relay valves the reservoir pressure should not fall below the control line pressure.

Control port pressures in excess of the reservoir pressures can damage the valve.

Typical Application
