## Suspension Exhaust Valve

Sep. 19, 2012

This 132000 and 132100 valves are designed to allow high speed exhausting of air suspensions. It is normally placed in line between the height control valve and the air springs. The dual delivery ports allow flexible tubing arrangement while maximizing the exhaust performance.

The built in pilot port can be used to reset the valve to the closed position (Automatic Reset) when pressurized. Connect this port to the supply line of the brake system and the valve will reset and fill the ride springs when the parking brakes are released. The valve includes a special breather (not a plug) for the pilot port that should be used if this feature is not be desired.

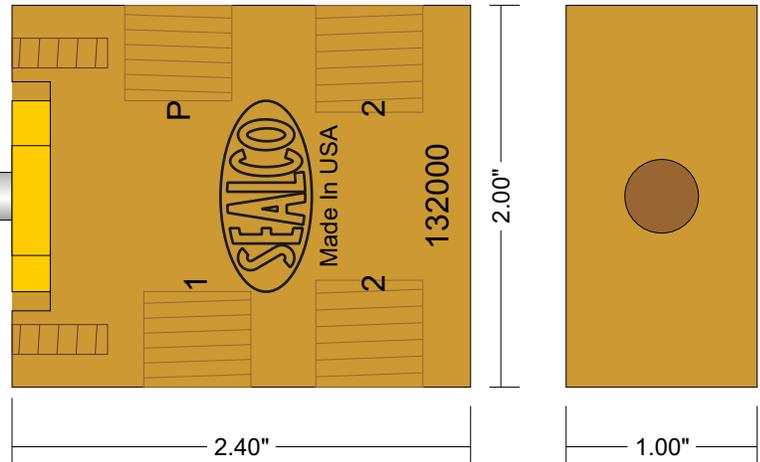

- Two delivery ports for very fast exhaust.
- 132000 mounts in place of 17610 & 996555
- 132100 Single hole mounting.
- Will not jump back when exhausting.
- Includes auto-reset pilot port.
- 1/4" NPT ports

### Part #132000

Three Hole Mounting  
Includes 8179 Plate

8179 Plate

### Part #132100

Single Hole Mounting  
With Weather Cap
